Introduction and reading map 3

F-I Foundation I: From Source to Manifestation. Accessible Algebras from a Source, Its Noise and a Readable Seed 4

F-II Foundation II: Shared Manifestation. Shared Structure, Public Calibration and Different Histories 30

F-III Foundation III: The Perfuming Loop. Held Content, Learned Frames and Physical Return 47

Introduction

Foundation asks whether the structures used elsewhere in the theory can exist, be shared and return into further physical action. A named algebra is not enough: its source, permitted operations, reference state and representation determine which conclusions can actually be inherited.

I connects source and noise to accessible hulls. Its finite centre example and conformal construction have distinct types; an internal standard Cut requires the latter's representation and modular conditions. II derives common structure under stated symmetry assumptions, separates agreement from correctness, and constructs a common finite-energy pulse whose weak-mixture tangent can enter the source-identification test of Consciousness II. Positive energy fixes a time orientation, not every charge orientation.

III connects held content, history-selected protection and physical return. In one finite semiclassical mean-action scalar/JT realization, the acquired record changes the apparatus source and a later X-basis probe receives the response in the same history. Its approximately 10^{-9} signal is an existence witness, not a useful amplifier. Separate quantum-material renewal constructions remain separately accounted for. The finite A result neither requires nor proves fixed-capacity sustained thermal updating B or joint sharp heat export and effective return C.

Reading map

F-I Source, noise and authorized seeds generate hulls of different types. Geometric inheritance requires the declared state, representation and internal standard Cut.

F-II Shared structure, shared state and correct public content are distinguished. Common finite-energy preparations provide a physical source-identification interface.

F-III Held content and finite physical return are realized with explicit resources. A history-selected frame and protected old quantum content are not the same code.
